## 64 Gbps High-Speed Differential Loopback Switch (DC coupled)

### Product Overview

#### Description

The MM5622 is a high-speed differential loopback switch (DC coupled) supporting the high-speed differential signal switching required in the latest PCIe Gen 5, Gen 6, SerDes, and other standards. The MM5622 is based on Menlo Micro's Ideal Switch® technology and can operate at 64 Gbps with a bandwidth of 20 GHz for high-performance applications. The MM5622 has low insertion loss, fast switching speed, and can operate with greater than 3 billion switching cycles. The MM5622 system-in-package (SiP) solution fully integrates the switch driver and charge pump controlled through SPI or GPIO interfaces by a host processor. In addition, integrated decoupling capacitors provide significant board footprint reduction for high-volume production test solutions. The MM5622 switch provides high data rate for full high-speed differential data applications with unprecedented levels of parallel testing for space-constrained final test and probe test. Applications include chip testing for smartphones, graphics, and network processors, as well as microprocessor, accelerator, and high-speed memory products.

#### Features

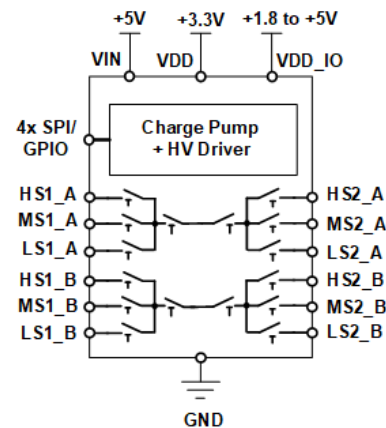

- DC to 20 GHz range
- Differential Dual DP3T switch with Loopback
- Normally Open, Reflective actuator
- Low Insertion Loss: -1.1 dB @ 16 GHz
- Integrated charge pump and driver eliminates the requirement for external biasing and driver circuitry
- Fully controllable ports for low, medium, and high data rate signal routing
- High Reliability: Greater than 3 billion switching operations
- 8.2 x 8.2 mm LGA Package

#### Markets

- Automated Test Equipment
- Measurement Equipment
- Semiconductor Final Package Test
- Compliance and Loopback Test

#### Applications

- High-Speed Data Digital Component Testing
- Optical-Electrical Module Testing
- High-Speed Signal Routing
- ATE Device Interface Boards
- Optical-Electrical Module Testing
- Differential Switch Matrices

## Electrical Specifications

### Operating Characteristics

#### Absolute Maximum Ratings

Exceeding the maximum ratings as listed in [Table 1](#) below may reduce the reliability of the device or cause permanent damage. Operation of the MM5622 should be restricted to the limits indicated in the recommended operating conditions listed in [Table 2](#).

#### Electrostatic Discharge (ESD) Safeguards

The MM5622 is a Class 0 ESD device. When handling the MM5622, observe precautions as with any other ESD sensitive device. Do not exceed the voltage ratings specified in [Table 1](#).

**Table 1. Absolute Maximum Ratings**

Parameter	Symbol	Minimum	Maximum	Unit
DC Supply Voltage	$V_{DD}$	-0.3	3.6	V
I/O Supply Voltage	$V_{DD\_IO}$	-0.3	5.5	V
Charge Pump Input	$V_{IN}$	-0.3	5.5	V
Driver Logic Input Levels		-0.3	$V_{DD\_IO} + 0.3$	V
Max Input Voltage Level (RF Pins) <sup>4</sup>		—	3.3	V
Hot Switching Voltage @ 0.5 V <sup>1,2</sup>		-0.5	0.5	V

**Notes:**

- For hot-switching, differential voltage across switch terminals must be less than or equal to 0.5 V and each switch port must be within +/-0.5 V of RF ground. See section [Hot Switch Restrictions](#).
- RF pins must not be allowed to electrically float during switch operation. See section [Floating Node Restrictions](#) for details on avoiding floating nodes.
- See section [Storage and Shelf Life](#) more information on shelf and floor life.
- RF pins include: HS1\_x, HS2\_x, MS1\_x, MS2\_x, LS1\_x, LS2\_x.
- Control and power pins include:  $V_{IN}$ ,  $V_{DD}$ ,  $V_{DD\_IO}$ , PULL\_UP, FLT\_MODE, FLTB, FLIP\_BIT, SCK/CTL1, MOSI/CTL2, MISO/CTL3, SSB/CTL4, CP\_EN.
- See JESD22-B104 for mechanical shock test methodology at 1.0 ms, half-sine, 5 shocks/axis, 6 axis.
- See JESD22-B103 for vibration test methodology at 3.1 G and 30min/cycle, 1 cycle/axis, 3 axis.

### Hot Switch Restrictions

The MM5622 is not intended for hot switching applications and care should be taken to insure that switching occurs at less than 0.5 V. Further, the voltage at the switch terminals must be within +/-0.5 V relative to signal ground.

### Floating Node Restrictions

RF pins must not be allowed to electrically float during switch operation and therefore require some form of DC path to ground to prevent charge accumulation. The MM5622 uses the superport configuration for improved high frequency performance. See Menlo Micro application note [Avoiding Floating Nodes](#) for a detailed explanation of the hazard conditions to avoid and recommended solutions.

Pin Name	Pin #	Description
<b>HS1A</b>	E15	Port 1A of the high-speed signal path. Can be used as an input or an output.
<b>HS1B</b>	H15	Port 1B of the high-speed signal path. Can be used as an input or an output.
<b>MS1A</b>	B15	Port 1A of the medium-speed signal path. Can be used as an input or an output.
<b>MS1B</b>	L15	Port 1B of the medium-speed signal path. Can be used as an input or an output.
<b>LS1A</b>	B12	Port 1A of the low-speed signal path. Can be used as an input or an output.
<b>LS1B</b>	B10	Port 1B of the low-speed signal path. Can be used as an input or an output.
<b>HS2A</b>	E2	Port 2A of the high-speed signal path. Can be used as an input or an output.
<b>HS2B</b>	H2	Port 2B of the high-speed signal path. Can be used as an input or an output.
<b>MS2A</b>	B2	Port 2A of the medium-speed signal path. Can be used as an input or an output.
<b>MS2B</b>	L2	Port 2B of the medium-speed signal path. Can be used as an input or an output.
<b>LS2A</b>	B5	Port 2A of the low-speed signal path. Can be used as an input or an output.
<b>LS2B</b>	B7	Port 2B of the low-speed signal path. Can be used as an input or an output.
<b>SCK/CTL1</b>	T10	Clock input in SPI mode; RF channel control in GPIO mode. Has an internal pull-down resistor.
<b>MOSI/CTL2</b>	T9	SPI data input (SDI) in SPI mode; RF channel control in GPIO mode. Has an internal pull-down resistor.
<b>MISO/CTL3</b>	T8	SPI data output (SDO) in SPI mode; RF channel control in GPIO mode. Has an internal pull-down resistor.
<b>SSB/CTL4</b>	T7	Chip select in SPI mode; RF channel control in GPIO mode. Has an internal pull-up resistor in SPI mode, and an internal pull-down resistor in GPIO mode.

Pin Name	Pin #	Description
FLT_MODE	T14	Fault Mode select in GPIO mode. Fault Mode is disabled if high. Has a built-in pull-down resistor. Pin is ignored in SPI mode.
FLTB	T16	Fault indicator in GPIO and SPI modes. Open drain output to allow “Wire-OR” of multiple ICs. Goes low when a fault is detected. Can be left open if not used. Pull-up voltage must be $\leq VDD\_IO$ .
FLIP_BIT	R16	This pin has an internal pull-down resistor. In SPI mode, this pin should be tied to VDD_IO. In GPIO mode FLIP_BIT should be tied to GND. Refer to <a href="#">Table 12</a> for more information.
MODE	T3	Logic level input to switch inputs between SPI and GPIO modes. MODE = 0 is SPI mode. MODE=1 is GPIO mode.
CP_EN	T6	Charge pump enable pin in GPIO mode. Pull-up to VDD_IO to enable the charge pump. Has a built-in pull-down resistor. Pin is ignored in SPI mode.
VDD	R4, T5	3.3 V nominal input to digital logic and internal level translators. Bypass with a low ESR 1 $\mu$ F ceramic capacitor.
VDD_IO	T4	For 3.3 V nominal digital I/O levels, connect to VDD. For alternate I/O levels, connect to a separate supply (+1.8V to +5.0V). Bypass with a low ESR 1 $\mu$ F ceramic capacitor if separate from VDD.
PULL_UP	T15	Connect this pin directly to the FLTB. Has a built-in 4.99 k $\Omega$ resistor to VDD_IO.
DGND	R3, T11	Digital ground, should be connected to PCB ground. The R3 pin has an internal pull-down resistor, it can be left floating.
VIN	P16	Connect to 5 V power supply. Bypass with a low ESR 1 $\mu$ F ceramic capacitor.
CPGND	T13	Charge pump ground, should be connected to PCB ground.
VPP	T1	High-voltage (90V) charge pump output. Leave this pin unconnected.
AGND	T12	Analog ground, should be connected to PCB ground.

# Programming

## Communication Interface

The MM5622 has two modes of operation; **SPI (serial)** and **GPIO (Parallel)**, selected by the **MODE** input pin.

All the SPI pins (except SSB pin), the FLIP\_BIT, the FLT\_MODE pin, and the CP\_EN pin have an internal pull-down resistor to ensure that no digital input pins are left floating.

The SSB pin has a pull-up current source in SPI mode. This ensures that the IC defaults to a disabled state in SPI mode. In GPIO mode, this pin is CTL4. In this case, the SSB pin has a pull-down resistor. This ensures that the input is low by default in GPIO mode.

Figure 8. SPI Timing Diagram

## Serial Communication

MODE = 0, activates the 16-Bit Serial Peripheral Interface (SPI) module for operation. Multiple devices can be daisy-chained to drive multiple ICs using one SPI bus (see [Daisy Chain Operation](#), [Figure 11.](#), [Figure 12.](#) and [Figure 13](#)). The SPI works at any frequency up to a maximum of 33 MHz and may operate at significantly lower frequencies if the logic signals adhere to the data setup and hold requirements.

## SPI Interface Mode

SPI timing diagrams are provided in [Figure 8](#) through [Figure 13](#). In SPI mode, data transmission starts when SSB goes Low, causing the Target to output the Most Significant Bit (MSB) of data to the SDO (MISO) pin. Data transfer from Host to Target takes place during the rising edge of the clock (SCK), which is idle when SSB is High. This mode of operation requires data for Host and Target to be present on SDI (MOSI) before the rising edge of the clock (defining SDI to SCK setup time). Data is pushed out of the SDO (MISO) pin during the falling edge of the clock. After the first 16-bit transaction, Host writes the latest data (DN) to Target, while Target passes its previous (DN-1) stored data to the Host. Data is latched into the internal

registers at the rising edge of SSB, if WR\_EN = 1.

### SPI Data Format

SPI data is sent in a 16-bit format. The first MSB bit (WE), if high, enables the Write mode. The following 7 MSB bits hold the Control and Fault Status bits. The 8 LSB bits hold the Switch State bits.

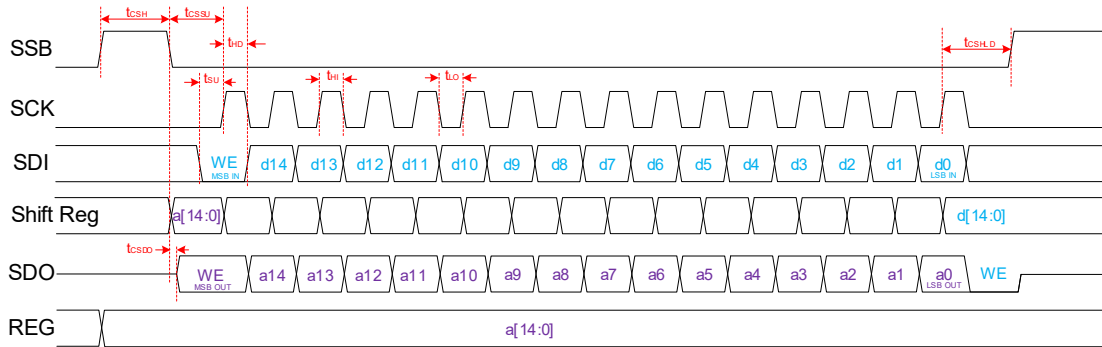

Figure 9. SPI Read Only (1 IC, No Daisy Chain)

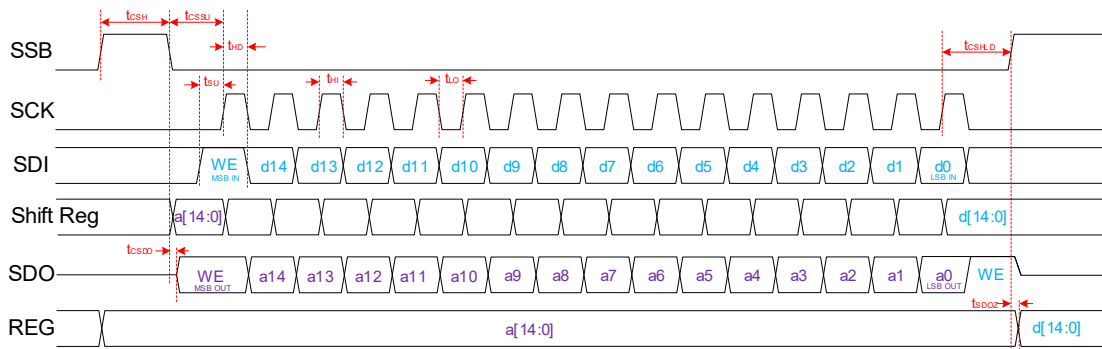

Figure 10. SPI Read & Write (1 IC, No Daisy Chain)

### SPI Control Registers

The SPI interface provides access to two 8-bit Internal Registers: Register STATE and Register CONTROL that are Read/Write registers. Register data is read by toggling SSB low and monitoring the data at the SDO pin while clocking the SCK pin. Register STATE holds the state of the 4 internal high-voltage outputs and is updated when SSB goes from LOW to HIGH, if the Write Enable bit is high.

Register CONTROL holds four control bits (CPEN, VPPCOMP, FLT\_MODE, and SLEEP), and the fault status bit (FSTAT). The MSB bit enables the Write mode if high. In SPI mode, the CP\_EN and FLT\_MODE pins are ignored. Settings in the CONTROL register are used instead.

**Note:** The first row of the register tables below shows the read/write type, and default state. At power-on-reset (POR), all bits in both registers are set to LOW internally.

#### State Register

- 0 = Disable Write mode (read only)

bit 6: FSTAT (see Note 1 below)

- 1 = VPP OR VDD Fault status = faulted
- 0 = VPP OR VDD Fault status = NOT faulted

bit 5: SLEEP

- 1 = SLEEP mode active (all analog circuits disabled)
- 0 = SLEEP mode inactive (all analog circuits enabled)

bit 4: FLTMODE

- 1 = Fault Mode Disabled (shutdown Disabled)
- 0 = Fault Mode Enabled (shutdown Enabled)

bit 3: VPPCOMP

- 1 = VPP under-voltage comparator is disabled.
- 0 = VPP under-voltage comparator is active.

bit 2: Do Not Care

This bit can be set to either state without effecting performance.

bit 1: CPEN

- 1 = Charge Pump is enabled
- 0 = Charge Pump is disabled

bit 0: Do Not Care

This bit can be set to either state without effecting performance.

---

#### Notes:

1. After this bit is set high, it must be written to 0 to clear the fault. If fault mode is enabled, CPEN must be toggled to restart the charge pump. See Fault Conditions for more information.

### Daisy Chain Operation

Daisy chaining the ICs is permitted and involves connecting the MISO of one chip to the MOSI of the next chip in the chain, as shown in [Figure 11](#). SPI timing diagrams with daisy-chained devices are provided in [Figure 12](#) and [Figure 13](#).

### GPIO Communication

MODE = 1 and FLIP\_BIT = 0 activates the GPIO (General Purpose Input Output or Parallel) Communication Mode. In this mode of operation, the SPI Interface pins act as parallel inputs, as described in [Table 11. Detailed Pin Description](#). Valid switch states are listed here.

Table 12. State Table in GPIO Mode

Count	Input Signals					HVOUT				Switch State
	FLIP_BIT	CTL4	CTL3	CTL2	CTL1	D	C	B	A	
0	0	0	0	0	0	OFF	OFF	OFF	OFF	ALL OFF (OPEN)
1	0	0	0	0	1	OFF	OFF	OFF	ON	
2	0	0	0	1	0	OFF	OFF	ON	OFF	
3	0	0	0	1	1	OFF	OFF	ON	ON	HS1 – HS2
4	0	0	1	0	0	OFF	ON	OFF	OFF	
5	0	0	1	0	1	OFF	ON	OFF	ON	LS1 – LS2
6	0	0	1	1	0	OFF	ON	ON	OFF	HS1 – LS1 and HS2 – LS2
7	0	0	1	1	1	OFF	ON	ON	ON	
8	0	1	0	0	0	ON	OFF	OFF	OFF	
9	0	1	0	0	1	ON	OFF	OFF	ON	MS1 – MS2
10	0	1	0	1	0	ON	OFF	ON	OFF	HS1 – MS1 and HS2 – MS2
11	0	1	0	1	1	ON	OFF	ON	ON	
12	0	1	1	0	0	ON	ON	OFF	OFF	MS1 – LS1 and MS2 – LS2
13	0	1	1	0	1	ON	ON	OFF	ON	
14	0	1	1	1	0	ON	ON	ON	OFF	
15	0	1	1	1	1	ON	ON	ON	ON	ALL ON (CLOSED)

## Fault Conditions

There are two comparators that can signal a fault condition - VDD under voltage fault and VPP under voltage fault. Faults are reported differently depending on the mode of communication - SPI or GPIO.

---

**Note:** The VPP under voltage comparator can be disabled. In SPI mode, it is disabled when the VPPCOMP bit in the CONTROL register is high. In GPIO mode, the comparator is disabled when CP\_EN pin is set low.

---

The outputs of the VDD and VPP fault comparators are logically OR'ed. The output of the OR gate controls the FLTB pin. FLTB is an open-drain output and is ON (low impedance) if either fault is detected. In SPI mode, bit 6 of the CONTROL register provides VDD and VPP fault status.

At start-up, the FLTB pin is held OFF (high impedance). It is allowed to change state only after each voltage goes past its Enable threshold (VDD goes higher than  $UVLO_{RISE}$  and VPP goes higher than  $V_{EN}$ ). This prevents a race condition at startup.

Once VDD and VPP go above their thresholds, the comparators monitoring VDD and VPP actively monitor for faults. If VDD goes below  $UVLO_{FALL}$  or VPP goes below  $VPP_{DIS}$ , a fault condition is signaled by setting the FLTB pin low and the Fault Status bit high (bit 6 in the CONTROL register). The FLTB pin returns to an open state when the fault condition is cleared and the FSTAT bit remains latched high until it is cleared via a SPI write. If Fault Mode is enabled (in GPIO mode, FLT\_MODE pin = 0, in SPI mode, FLT\_MODE bit = 0), the internal high-voltage outputs are all set low (all switches open) and the charge pump is turned off. The user must toggle the CP\_EN pin (GPIO mode) or the CPEN register bit (SPI mode) low and then high to restart the device.

If Fault Mode is disabled (in GPIO mode, FLT\_MODE pin = 1; in SPI mode, FLT\_MODE bit = 1), no action is taken by the IC. The fault condition is reported but does not affect the charge pump operation or switch states.

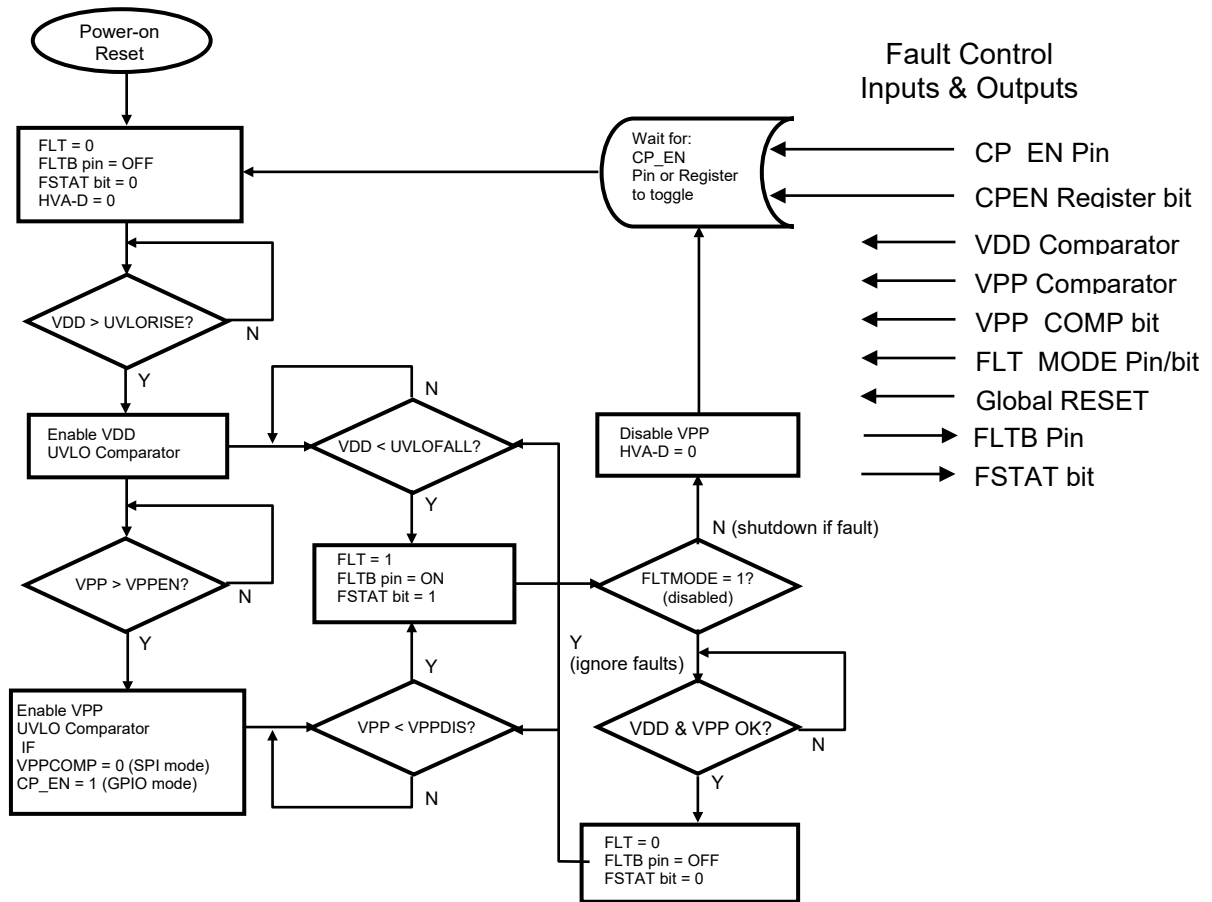

Figure 14. Flowchart for Fault

Notes:

1. The un-faulted supply continues to be monitored when a fault occurs. The FLT signal remains faulted until both supplies are above their brownout trip level.
2. VDD\_IO is not monitored unless it is connected to VDD.
3. VPP is not monitored if: VPPCOMP = 1 in SPI mode OR the CP\_EN pin is low In GPIO mode.

## Recommended Solder Reflow Profile

Figure 20. Reflow Profile

Reflow profiles and assembly guidelines are given for RoHS-compliant (lead-free) solder alloy.

Follow Moisture Sensitivity Level (MSL) 3 handling precautions specified in IPC/JEDEC J-STD-020.

## Storage and Shelf Life

Under typical industry storage conditions ( $\leq 30$  °C/60% RH) in Moisture Barrier Bags, the following is recommended:

- Customer Shelf Life: 24 months from customer receipt date.
- Extended Shelf Life: 60 months from customer receipt date if re-bagged every 24 months or less.
